ABSTRACT:

The proposed **Smart Expense Tracker** is a web-based personal finance management system designed to provide a simple and efficient platform for managing income, expenses, budgets, savings, and financial activities. The system provides a secure user authentication module that allows users to register, log in, and manage their personal financial information.

The Dashboard provides users with an overview of their financial status, including total income, total expenses, balance, savings, spending trends, and category-wise expenses. The Transaction Module allows users to add, view, edit, delete, search, and filter their income and expense records based on categories, transaction types, and dates.

The Budget Management Module allows users to set spending limits and monitor their actual expenses. The system identifies whether a budget is on track, approaching the limit, or exceeded, and can generate alerts when spending exceeds the defined budget. The Savings Module allows users to create savings goals, track their progress, and manage funds towards their targets.

The Analytics Module provides information about spending patterns, high-spending categories, daily spending, and monthly expenditure trends. The Reports Module generates monthly, category-wise, income, budget, and savings reports with options for CSV export and printing.

The system is developed using HTML, CSS, JavaScript, PHP, and MySQL, with PDO used for database connectivity and Chart.js used for graphical financial visualization. The database follows Third Normal Form (3NF) and uses primary keys, foreign keys, relational views, aggregate functions, joins, subqueries, and other SQL operations to demonstrate practical DBMS concepts.
